

# BETWEEN

the sea and the sky

TC3033

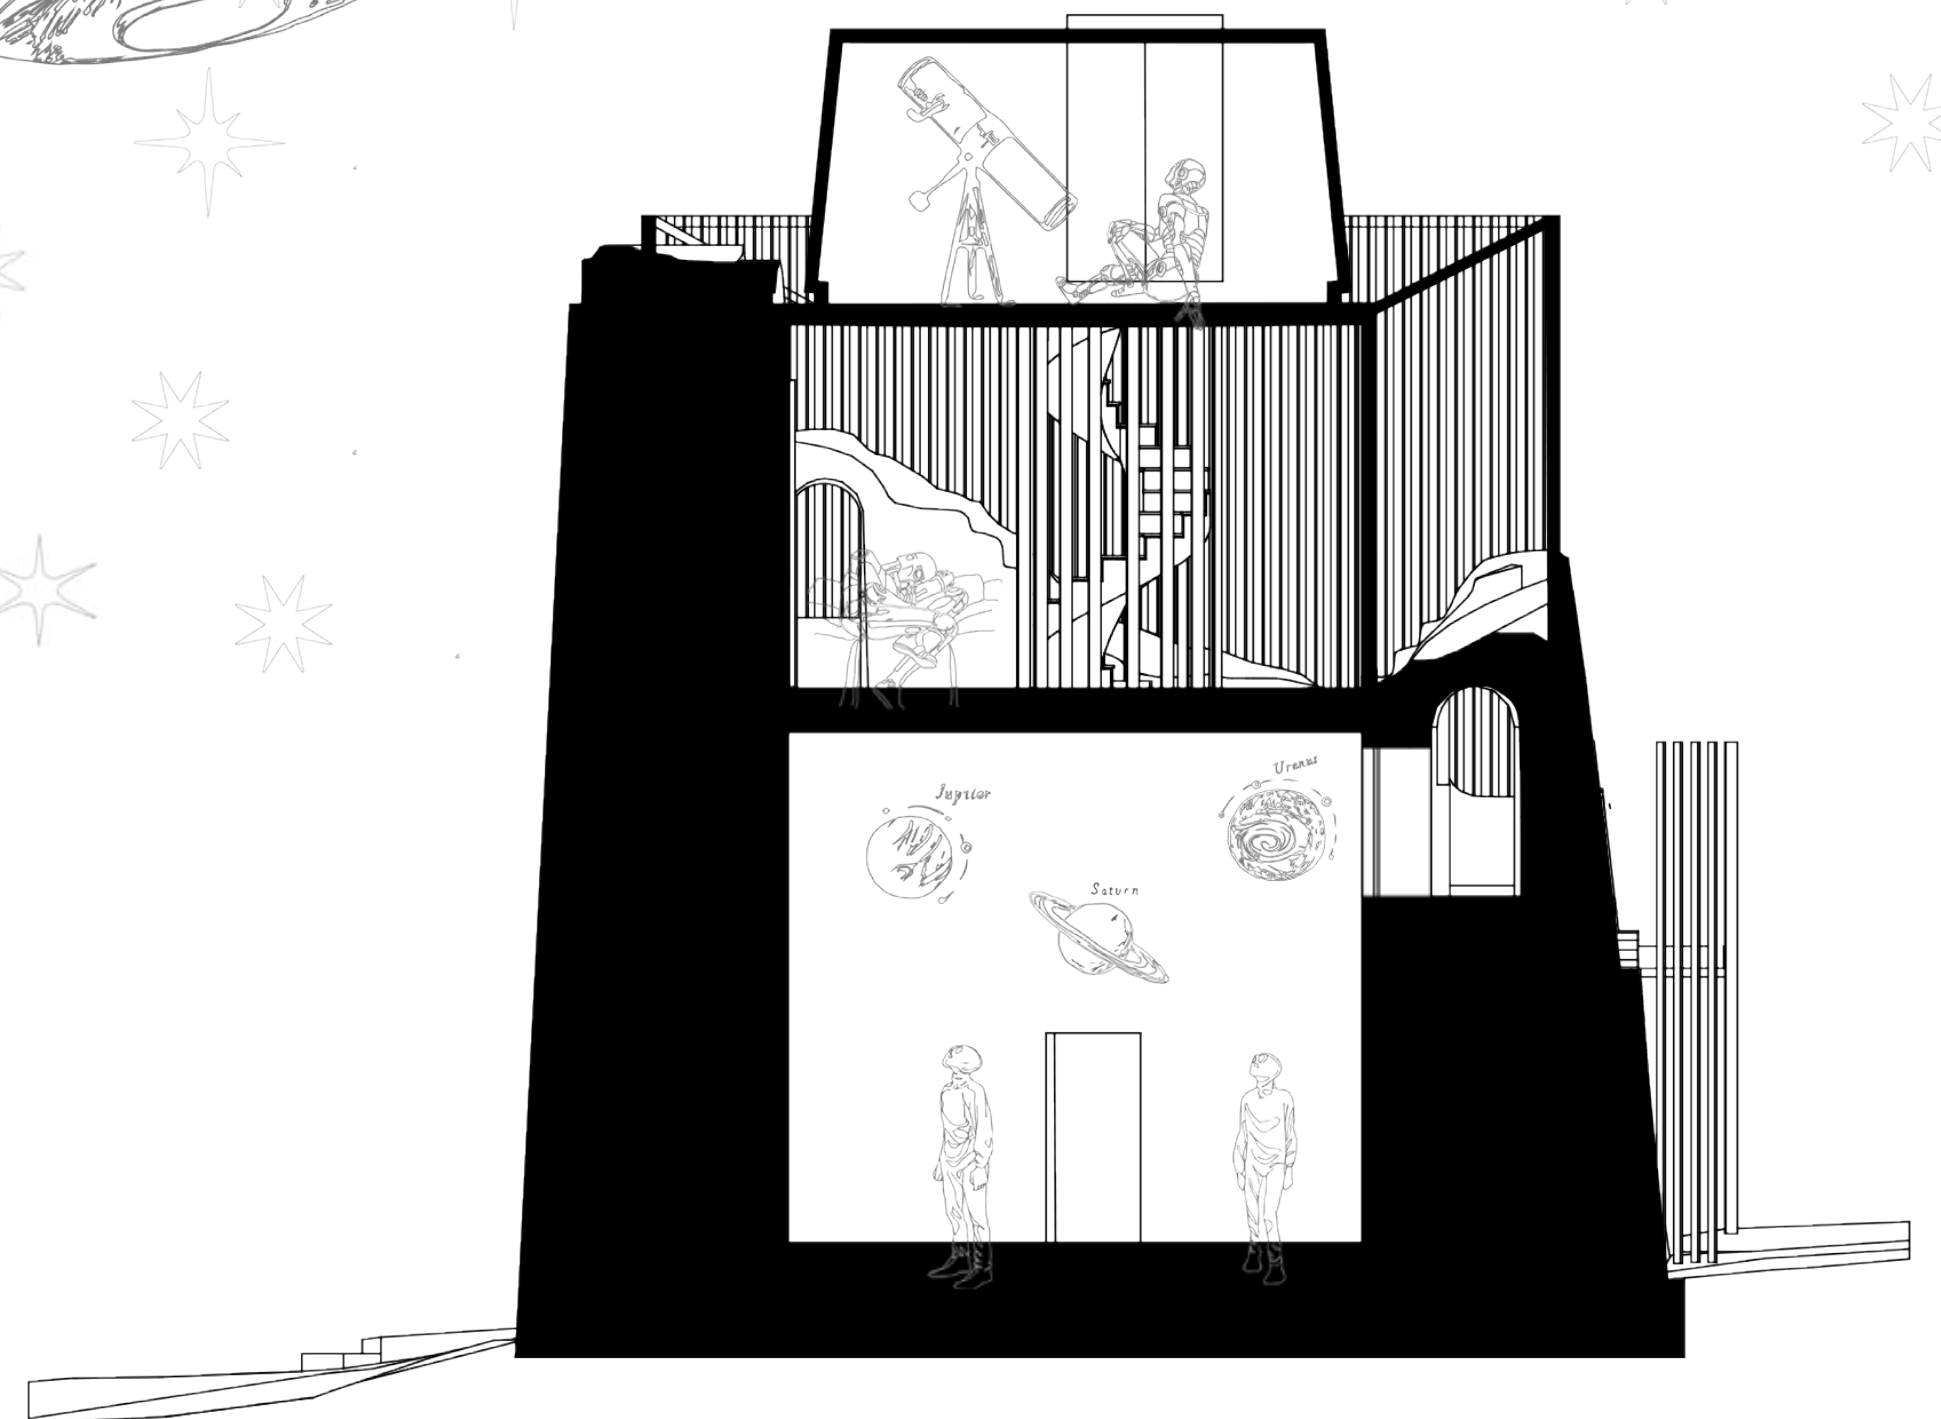

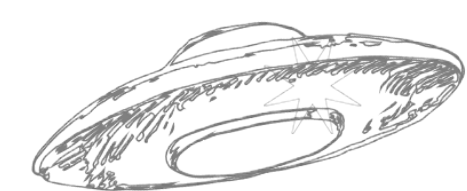

siteplan 1:500

floorplan 1:200

In the province of Torre Rinalda there is a tower that once served as a system of fortification. We believe that the world will be safe one day and people will no longer have to be scared of attack and think of how to defend themselves. We believe that now is the time to start creating and stop destroying. That is why we decided to give this object has a research and educational function, so that people on the seashore can look at the stars and get acquainted with the solar system and find some peace BETWEEN the stars and the sea.

The first floor of the structure is given over to the planetarium since it is dark inside and it is possible to build a structure similar to the Eisa Eisingas planetarium in the Netherlands. The staircase completed from the south facade allows you to get to the second floor, where there is a small reading room with magazines about astronomy. From this hall, you can get to the observatory via a spiral staircase and see the sky full of stars through a telescope. The slat facade creates movement and plays with light.
